

Gen AI Engineer Assessment - Nationale Nederlanden

Great that you are interested in joining Nationale-Nederlanden for the position of GenAI Engineer. Today we would like to learn more about your technical skills. We have some exercises prepared to get to know you, your hands-on skills and your way of working and thinking a bit better. You will need roughly 90 minutes for five different exercises.

Prerequisites

But first, let's verify if you have the following prerequisites in order.

- Do you have tooling installed on your device (such as Curl or Postman to do https requests)?
- Have python installed on your device?
- Access to one free LLM ([Free LLM Providers](#))
- Access to [Langchain](#)

Exercise 1

Let's start with a small simple program - in Python - that fetches the data results from the following API endpoint: <https://randomuser.me/api/?results=20>

Exercise 2

Ok. Next! Can you create a function that accepts and formats the response of the API in such a way that the result is an array of strings, where each string is a concatenation of the first name and last name. Please filter out the people for us who are born after the year 2000. Finally, can you also log the output to the console so that it looks like the example below.

```
[  
  'James Bond',  
  'Ash Ketchum'  
]
```

Exercise 3

Awesome, well on your way! Of course, we want to make sure this functionality keeps working in the future. Can you write at least one test - using any framework of your choice - to test your functionality.

Exercise 4

Here we would like you to call an [LLM \(Free LLM Providers\)](#) and find out who the person is (note- due to free pricing, keep an eye on rate limit – for this exercise you can stick to 5 random people)?

Exercise 5

Great, your program is running. Can you now create an agentic workflow using [Langchain](#) to give more details on the best work that person has done (keep an eye on limits again)?

Bonus Exercise

- You may notice not all people have something that stands out, how can you present it better in the results?
- How can you improve performance of the application?
- Can you create an architecture flow of the exercises?
- Are there any best practices you would consider?

Sharing code/presentation/feedback - Please share a brief [presentation](#) of how you would like to explain the assignment, [source code](#) - .py / .ipynb files, this can be done by compressing all in a zip file and sharing it in an email. In addition, please let us know how you [experience](#) the assignment. Was it easy, medium, or hard assessment? Also, 90 minutes was enough.
